

Edukativni kutak: podkasti i video-sadržaji o suši i klimatskim promenama

Ovaj edukativni materijal namenjen je građanima i svim zainteresovanim korisnicima koji žele da bolje razumeju sušu, klimatske promene i njihove posledice po životnu sredinu, poljoprivredu, vodne resurse i svakodnevni život. Dokument predstavlja izbor podkasta, televizijskih emisija i drugih video-sadržaja u kojima stručnjaci iz različitih oblasti na razumljiv i pristupačan način objašnjavaju aktuelne klimatske i vodne izazove u Srbiji.

Odabrani sadržaji obuhvataju teme kao što su klimatske promene i ekstremni vremenski događaji, suše i poplave, toplotni talasi, degradacija zemljišta i prašinske oluje, nestašice vode, kao i posledice ovih pojava po poljoprivredu, ekonomiju i društvo. Posebna pažnja posvećena je pitanjima prilagođavanja klimatskim promenama, održivog upravljanja vodnim resursima i navodnjavanja kao jedne od važnih mera za povećanje otpornosti poljoprivrede na sve učestalije suše.

Osnovni cilj ovog edukativnog kutka jeste podizanje svesti i unapređenje znanja građana o suši, klimatskim promenama i odgovornom upravljanju vodnim resursima. Kroz pažljivo odabrane audio-vizuelne sadržaje, korisnicima se omogućava da na jednostavan i zanimljiv način upoznaju uzroke i posledice ovih pojava, ali i moguća rešenja i mere prilagođavanja. Na taj način, materijal treba da doprinese boljem razumevanju klimatskih rizika i značaja aktivnog i odgovornog odnosa prema vodi, zemljištu i životnoj sredini.

Tanjug TV (25.12.2025):

Godina ekstrema: 2025. među najtoplijim godinama u istoriji merenja – dr Irida Lazić • GLAS PLANETE

<https://www.youtube.com/watch?v=jMNIUv-yApU>

Opis: Globalno posmatrano, 2025. godina će se svrstati među tri najtoplije godine u istoriji meteoroloških merenja. Ekstremni vremenski događaji širom sveta ponovo su pokazali da klimatske promene utiču na kvalitet života, infrastrukturu i ekonomije mnogih zemalja. Toplotni talasi širom Evrope oborili su rekorde, dok su poplave u Aziji i šumski požari u Sjedinjenim Američkim Državama postali gotovo svakodnevna pojava. U petnaestoj epizodi emisije „Glas Planete“, klimatolog Irida Lazić analizira najznačajnije klimatske događaje tokom prethodnih 365 dana.

K1 televizija (12.04.2024.):

Preti li nam zaista klimatska katastrofa? | Irida Lazić | URANAK1

<https://www.youtube.com/watch?v=08-Q8SrAFEA&t=270s>

Opis: Protekla decenija bila je najtoplija od početka merenja temperature, upozoravaju naučnici. Mart je bio najtopliji mesec ikada zabeležen u Srbiji. Da li nam zaista preći klimatska katastrofa? Da li se porast globalne temperature još uvek može sprečiti? Ovo su pitanja koja postavljamo Iridi Lazić.

Agelast podcast (21.07.2024.):

Kako smo stvorili ekstremne vrućine i superćelijske oluje | Vladimir Đurđević, klimatolog | 241

<https://www.youtube.com/watch?v=8H5xY-z0rrA>

Opis: Poslednjih nedelja svedočimo toplotnim talasima kakve ranije nismo doživljavali. Toplotni talasi sami po sebi nisu nova pojava, ali njihov intenzitet, trajanje i učestalost svakako jesu. Do pre približno jedne decenije takvi ekstremni uslovi nisu bili uobičajeni. Istovremeno su se povećali i intenzitet i učestalost obilnih padavina, koje često dovode do poplava. Svake godine negde na planeti beležimo nove temperaturne rekorde, nezabeležene suše i brojne druge klimatske i meteorološke pojave.

U kojoj meri su ovi događaji deo takozvanog opsega prirodne varijabilnosti, a u kojoj meri predstavljaju posledice klimatskih promena izazvanih ljudskim delovanjem? Kako možemo jasno razlikovati jedno od drugog? Kako klimatologija funkcioniše kao naučna disciplina i kako su naučnici utvrdili koji su efekti posledica masovne upotrebe fosilnih goriva, a koji su deo prirodnih ciklusa, kao što su Milankovićeve ciklusi? Šta se dogodilo sa Pariskim sporazumom? Šta tačno znači globalni porast temperature od 1 °C i kakve su posledice takvog zagrevanja?

O ovim i mnogim drugim temama u ovoj epizodi razgovarali smo sa Vladimirom Đurđevićem, meteorologom i klimatologom, profesorom na Katedri za meteorologiju Fizičkog fakulteta Univerziteta u Beogradu i stručnjakom za simulacije klime i klimatskih promena za region jugoistočne Evrope.

Agelast podkast (09.11.2025.):

Čovek je izmenio 70% kopnenih površina za svoje potrebe – kakve su posledice? | Ana Vuković Vimić

<https://www.youtube.com/watch?v=QO3-7Z-b5mc&t=3306s>

Opis: Sedmi jul ove godine ne bi bio posebno značajan datum da nije bilo velike oluje koja je izazvala znatnu materijalnu štetu. To je verovatno prva asocijacija mnogih ljudi na ovaj događaj. Međutim, neobično je bilo to što je u pitanju bila prašinska oluja. Ali šta je zapravo prašinska oluja, kako nastaje i zašto je važno razumeti ovu pojavu? Kako je povezana sa klimatskim promenama, kako sa neodgovornim ljudskim aktivnostima i koliko dalekosežne mogu biti njene posledice? I zašto su takve oluje počele da se pojavljuju u našem regionu?

Istog dana, pored snimaka „Ćacilenda“ koji odnosi vetar, pojavili su se i snimci pogleda na Dunav — s tim da se sam Dunav nije mogao videti zbog ogromne količine čestica prašine u vazduhu. Ubrzo nakon toga zabeležena je i pojava takozvanih „prašinskih đavola“, vazдушnih vrtloga koji su veoma neuobičajeni za našu klimu i geografsko područje.

Ova pojava predstavlja veoma jasan i nedvosmislen simptom koji ukazuje na to da je započeo proces dezertifikacije zemljišta — ili, jednostavnije rečeno, degradacije i devastacije zemljišta — kao posledica klimatskih promena, ali i neodgovornog odnosa prema poljoprivrednom zemljištu. Ona nosi i potencijalni rizik od infekcija poznatih kao „Valley Fever“, a ukoliko ne preduzmemo mere, ovaj problem će postajati sve ozbiljniji, opasniji i učestaliji.

Naravno, država ne izdvaja dovoljno sredstava za prognoziranje, kartiranje i sisteme ranog upozoravanja, uprkos tome što imamo kvalifikovane stručnjake. Međutim, to je samo mali deo šireg problema sa kojim se suočavamo.

O fenomenu prašinskih oluja — i o mnogo čemu drugom — razgovarali smo sa našom novom gošćom, prof. dr Anom Vuković Vimić, meteorologom i klimatologom, redovnom profesorkom Poljoprivrednog fakulteta Univerziteta u Beogradu, jednom od vodećih svetskih stručnjakinja u oblasti prašinskih oluja i potpredsednicom globalnog naučnog tela u okviru Svetske meteorološke organizacije Ujedinjenih nacija posvećenog unapređenju sistema upozoravanja na prašinske oluje.

Klima101 podcast (09.09.2021.):

Da li je pošumljavanje rešenje za klimatske promene?

https://www.youtube.com/watch?v=RLE_7lrQJtQ

Opis: Projekti pošumljavanja velikih razmera poslednjih godina postaju sve popularniji, kako u Srbiji tako i širom sveta, i često se predstavljaju kao jedan od glavnih alata u borbi protiv klimatskih promena. Ali da li je zaista tako jednostavno?

U ovoj epizodi razmatramo potencijal pošumljavanja kao ključne strategije za ublažavanje klimatskih promena, kao i brojne faktore koji određuju da li projekat pošumljavanja može uspešno da se sprovede i ostvari planirane koristi za životnu sredinu. Takođe razmatramo trenutno stanje šuma u Srbiji i ističemo izuzetnu biološku raznovrsnost zemlje, koja se ogleda u više od 70 različitih vrsta drveća i drvenastih biljaka koje prirodno rastu i uspevaju u ovom regionu.

Da bismo bolje razumeli ovu temu, pridružuju nam se Vladimir Đurđević sa Fizičkog fakulteta Univerziteta u Beogradu, Tijana Ležaić i Dejan Stojanović. Zajedno pružaju dragocene uvide u mogućnosti, izazove i ograničenja pošumljavanja kao mere za ublažavanje klimatskih promena.

Klima101 podcast (12.05.2021.):

Koje su posledice klimatskih promena?

<https://www.youtube.com/watch?v=UXQiJH-7efo>

Opis: Tokom poslednjih 150 godina Zemlja se zagrejala za približno 1,2 °C. Iako je porast temperature najvidljivija posledica klimatskih promena, globalno zagrevanje sa sobom donosi širok spektar drugih posledica. Topljenje polarnih ledenih kapa i glečera, porast nivoa mora, snažnije oluje, učestalije suše i sve izraženiji vremenski ekstremi predstavljaju neke od izazova sa kojima ćemo se verovatno suočavati u budućnosti ukoliko se emisije gasova sa efektom staklene bašte značajno ne smanje.

Koliko bi planeta mogla dodatno da se zagreje? Koliko bi nivo mora mogao da poraste? Da li će ljudska civilizacija moći da se prilagodi ovim promenama? I kakve posledice poljoprivrednici u Srbiji već danas osećaju?

Ovo su neka od pitanja koja se razmatraju u drugoj epizodi Klima101 podkasta. Gosti: Vladimir Đurđević i Aleksandar Luković

Nova S televizija (17.07.2024.):

Planeta gori | Gošća: Irida Lazić

<https://www.youtube.com/watch?v=onKQXjsaLQM&t=68s>

Opis: Klimatske promene odnose se na dugoročne promene temperatura i vremenskih obrazaca. Takve promene mogu biti prirodne, usled promena Sunčeve aktivnosti ili velikih vulkanskih erupcija. Međutim, od 19. veka ljudske aktivnosti predstavljaju glavni pokretač klimatskih promena, prvenstveno zbog sagorevanja fosilnih goriva kao što su ugalj, nafta i gas. Sagorevanjem fosilnih goriva nastaju emisije gasova sa efektom staklene bašte koje deluju poput pokrivača oko Zemlje, zadržavaju Sunčevu toplotu i povećavaju temperaturu. Glavni gasovi sa efektom staklene bašte koji uzrokuju klimatske promene uključuju ugljen-dioksid i metan. Oni nastaju, na primer, korišćenjem benzina za vožnju automobila ili uglja za grejanje zgrada. Krčenje zemljišta i seča šuma takođe mogu osloboditi ugljen-dioksid. Poljoprivreda, kao i aktivnosti u sektoru nafte i gasa, veliki su izvori emisija metana. Energetika, industrija, saobraćaj, zgrade, poljoprivreda i korišćenje zemljišta spadaju među glavne sektore koji uzrokuju emisije gasova sa efektom staklene bašte.

Insajder televizija (26.05.2026):

Više od 200.000 ljudi bez vode u zapadnoj Srbiji: građani ogorčeni zbog nestašice vode

<https://www.youtube.com/watch?v=MUQkiLR-Abw>

Opis: Više od 200.000 ljudi u zapadnoj Srbiji provelo je jučerašnju letnju vrućinu bez vode nakon velikog kvara na sistemu vodosnabdevanja Rzav, koji snabdeva opštine Požega, Čačak, Lučani i Gornji Milanovac. Prema zvaničnom saopštenju Grada Čačka, stanovnici su obavešteni da voda iz česme narednih deset dana neće biti pogodna za piće. Prema trenutnim procenama, očekuje se da će vodosnabdevanje u ovom delu zapadne Srbije biti postepeno obnovljeno do danas u podne.

Zbog nestašice vode juče je proglašena vanredna situacija i u Čačku i u Gornjem Milanovcu. Javno komunalno preduzeće „Vodovod“ Čačak objavilo je lokacije cisterni sa pijaćom vodom i saopštilo da su prioritetni korisnici, uključujući gradsku bolnicu i nekoliko vrtića, snabdeveni. Građani, međutim, i dalje izražavaju nezadovoljstvo. Prema njihovim navodima, tokom celog jučerašnjeg dana bilo je veoma malo cisterni, zbog čega mnogi ljudi, uprkos vanrednim merama, nisu imali adekvatan pristup pijaćoj vodi.

Agromedia podkast (22.02.2026):

Klimatski ekstremi u Srbiji: suše, poplave i milijarde štete | Uroš Davidović

<https://www.youtube.com/watch?v=zYyGKXUmdss>

Opis: Gost ove epizode podkasta Agro Priče je Uroš Davidović, meteorolog i ekonomista, sa kojim otvoreno razgovaramo o stvarnim posledicama suša i poplava u Srbiji i njihovom uticaju na poljoprivredu, ekonomiju i svakodnevni život. Između 2001. i 2024. godine klimatski ekstremi prouzrokovali su štetu veću od 10 milijardi evra, pri čemu je najveći deo gubitaka povezan sa sušom i poljoprivrednim sektorom. Razorne poplave iz 2014. godine pokazale su da stvarni troškovi ekstremnih vremenskih događaja daleko prevazilaze početne procene, jer indirektni uticaji pogađaju proizvodnju energije, lance snabdevanja hranom, infrastrukturu i širu ekonomiju.

Da li će suše u budućnosti postajati učestalije i dugotrajnije? Zašto se Srbija smatra jednom od klimatski najranjivijih zemalja u Evropi? I kako prilagođavanje poljoprivrede promenljivim klimatskim uslovima zapravo izgleda u praksi?

U ovoj epizodi razmatramo ekonomske troškove klimatskih promena, rastuće rizike povezane sa ekstremnim vremenskim događajima i mere potrebne za jačanje otpornosti poljoprivrede i društva u celini.

Tanjug TV (03.07.2025.):

Ekstremna suša u Srbiji | Marija Ćosić

https://www.youtube.com/watch?v=VUEOT_YdPGQ

Opis: Nedavni period nisu obeležile samo izuzetno visoke temperature, već i ekstremna suša koja utiče na poljoprivredne prinose, ekonomiju i svakodnevni život ljudi. U velikim delovima Srbije više od mesec dana nije bilo značajnijih padavina. Zemljište je postalo suvo i ispucalo, pojavili su se problemi sa vodosnabdevanjem, a poljoprivrednici su sve zabrinutiji za budućnost.

Kako se društvo može prilagoditi ovim novim klimatskim uslovima? Koje mere se mogu preduzeti kako bi se smanjile posledice suše? I koliko smo spremni za učestalije i ozbiljnije suše u godinama koje dolaze?

Ovo su samo neka od pitanja o kojima se razgovaralo sa Marijom Ćosić, koja iznosi uvide u uzroke i posledice suše, njenu povezanost sa klimatskim promenama i izazove sa kojima se suočavaju poljoprivreda i upravljanje vodama u Srbiji.

Agrocast (03.05.2025.)

Navodnjavanje u Srbiji – veliki potencijal, pogrešan pristup! | Aleksa Lipovac | AgroCast 83

<https://www.youtube.com/watch?v=F9T63epyHsk>

Opis: Tema ove epizode je navodnjavanje, jedan od ključnih faktora za obezbeđivanje stabilne i održive poljoprivredne proizvodnje u uslovima sve učestalijih suša i promenljive klime. Neka od glavnih pitanja o kojima se razgovara uključuju:

- Koliko se poljoprivrednog zemljišta trenutno navodnjava u Srbiji i koje metode navodnjavanja se najčešće koriste?
- Šta bi se dogodilo kada bi se svi poljoprivrednici oslanjali isključivo na zahvatanje podzemnih voda iz bunara?
- Koje je dugoročno, sistemsko rešenje za razvoj navodnjavanja u Srbiji?
- Kakav je kvalitet raspoloživih vodnih resursa za navodnjavanje?
- Kakav uticaj navodnjavanje može imati na svojstva zemljišta i njegovu dugoročnu produktivnost?

Zajedno sa Aleksom Lipovcem, razgovor obuhvata trenutno stanje infrastrukture za navodnjavanje, korišćenje podzemnih i površinskih voda, raspoloživost vode, efikasnost navodnjavanja, rizike od zaslanjivanja zemljišta i izazove razvoja poljoprivrede otporne na klimatske promene u Srbiji.

Epizoda se takođe bavi strategijama održivog upravljanja vodama, ulogom velikih sistema za navodnjavanje i značajem usklađivanja potreba poljoprivrede za vodom sa zaštitom vodnih resursa i kvaliteta zemljišta.

Educational Corner: Podcasts and Video Content on Drought and Climate Change

This educational material is intended for citizens and all interested users who wish to gain a better understanding of drought, climate change, and their impacts on the environment, agriculture, water resources, and everyday life. The document presents a selection of podcasts, television programmes, and other video content in which experts from different fields explain current climate- and water-related challenges in Serbia in a clear and accessible way.

The selected content covers topics such as climate change and extreme weather events, droughts and floods, heatwaves, land degradation and dust storms, water shortages, as well as the impacts of these phenomena on agriculture, the economy, and society. Particular attention is given to climate change adaptation, sustainable water resources management, and irrigation as an important measure for increasing the resilience of agriculture to increasingly frequent droughts.

The main objective of this Educational Corner is to raise awareness and improve citizens' knowledge of drought, climate change, and responsible water resources management. Through carefully selected audiovisual content, users are provided with an accessible and engaging way to learn about the causes and consequences of these phenomena, as well as possible solutions and adaptation measures. In this way, the material aims to contribute to a better understanding of climate-related risks and the importance of an active and responsible approach to water, soil, and the environment.

Tanjug tv (25.12.2025):

A Year of Extremes: 2025 Ranks Among the Warmest Years on Record – Dr. Irida Lazić • VOICE OF THE PLANET

<https://www.youtube.com/watch?v=jMNIUv-yApU>

Description: Globally, the year 2025 will rank among the three warmest years in the history of meteorological measurements. Extreme weather events around the world have once again demonstrated that climate change is affecting quality of life, infrastructure, and the economies of many countries. Heatwaves across Europe shattered records, while floods in Asia and wildfires in the United States have become almost an everyday occurrence. In the fifteenth episode of the show “Glas Planete” (“Voice of the Planet”), climatologist Irida Lazić analyzes the most significant climate events of the past 365 days.

K1 television (12.04.2024.):

Are We Truly Facing a Climate Catastrophe? | Irida Lazić | URANAK1

<https://www.youtube.com/watch?v=08-Q8SrAFEa&t=270s>

Description: The past decade has been the warmest since temperature measurements began, scientists warn. March was the warmest month ever recorded in Serbia. Are we truly facing a climate catastrophe? Can the rise in global temperatures still be prevented? These are the questions we ask Irida Lazić

Agelast podcast (21.07.2024.):

How We Created Extreme Heatwaves and Supercell Storms | Vladimir Đurđević, Climatologist | 241

<https://www.youtube.com/watch?v=8H5xY-z0rrA>

Description: In recent weeks, we have been witnessing heatwaves unlike anything we have experienced before. Heatwaves themselves are not a new phenomenon, but their intensity, duration, and frequency certainly are. Until about a decade ago, such extreme conditions were not common. Alongside them, both the intensity and frequency of heavy rainfall events have increased, often resulting in floods. Every year, somewhere on the planet, we record new temperature records, unprecedented droughts, and numerous other climatic and meteorological phenomena.

To what extent are these events part of the so-called range of natural variability, and to what extent are they consequences of human-induced climate change? And how can we clearly distinguish between the two? How does climatology function as a scientific discipline, and how have scientists determined which effects are caused by the massive use of fossil fuels and which are part of natural cycles, such as the Milankovitch cycles? What happened to the Paris Agreement? What exactly does a global temperature increase of 1°C mean, and what are the consequences of such warming?

We discussed these and many other topics in this episode with Vladimir Đurđević, meteorologist and climatologist, professor at the Department of Meteorology at the Faculty of Physics, University of Belgrade, and an expert in climate and climate change simulations for the Southeast European region.

Agelast podcast (09.11.2025.):

Humans Have Altered 70% of the Earth's Land Surface for Their Own Needs – What Are the Consequences? | Ana Vuković Vimić

<https://www.youtube.com/watch?v=QO3-7Z-b5mc&t=3306s>

Description: July 7 of this year would not have been a particularly significant date had it not been for a major storm that caused substantial material damage. That is probably the first association many people have with this event. What was unusual about this storm, however, was that it was a dust storm. But what exactly is a dust storm, how does it form, and why is it important to understand this phenomenon? How is it connected to climate change, how is it related to irresponsible human activity, and how far-reaching can its consequences be? And why have such storms started appearing in our region?

On the same day, alongside videos of “Ćacilend” being blown away, footage also emerged showing views of the Danube — except the Danube itself could not be seen because of the massive amount of dust particles in the air. Shortly afterward, we also observed the phenomenon of so-called “dust devils,” whirlwinds of air that are highly unusual for our climate and geographical area.

This phenomenon is a very clear and unambiguous symptom indicating that a process of land desertification — or, more simply put, land degradation and devastation — has begun, as a consequence of climate change but also irresponsible treatment of agricultural land. It also carries the potential risk of infections better known as “Valley Fever,” and unless we take action, this problem will become increasingly severe, dangerous, and frequent.

Of course, the state does not allocate sufficient resources for forecasting, mapping, and early warning systems, despite the fact that we do have qualified experts. However, this is only a small part of the broader problem we are facing.

We discussed the phenomenon of dust storms — and much more beyond that — with our new guest, Prof. Dr. Ana Vuković Vimić, meteorologist and climatologist, full professor at the Faculty of Agriculture, University of Belgrade, one of the world’s leading experts in the field of dust storms, and Vice-Chair of the global scientific body within the World Meteorological Organization of the United Nations dedicated to improving dust storm warning systems.

Klima101 Podcast (09.09.2021.):

Is Afforestation the Solution to Climate Change?

https://www.youtube.com/watch?v=RLE_7IrQJtQ

Description: Large-scale afforestation projects have become increasingly popular in recent years, both in Serbia and around the world, and are often presented as one of the main tools in the fight against climate change. But is it really that simple?

In this episode, we discuss the potential of afforestation as a key strategy for mitigating climate change, as well as the many factors that determine whether an afforestation project can be successfully implemented and achieve its intended environmental benefits. We also explore the current state of forests in Serbia and highlight the country's remarkable biodiversity, reflected in more than 70 different tree and woody plant species that naturally grow and thrive in the region.

To help us better understand this topic, we are joined by Vladimir Đurđević from the Faculty of Physics, University of Belgrade, Tijana Ležaić, and Dejan Stojanović. Together, they provide valuable insights into the opportunities, challenges, and limitations of afforestation as a climate change mitigation measure.

Klima101 Podcast ((12.05.2021.):

What Are the Consequences of Climate Change?

<https://www.youtube.com/watch?v=UXQjJH-7efo>

Description: Over the past 150 years, the Earth has warmed by approximately 1.2°C. While rising temperatures are the most visible consequence of climate change, global warming brings with it a wide range of other impacts. Melting polar ice caps and glaciers, rising sea levels, stronger storms, more frequent droughts, and increasing weather extremes are all among the challenges we are likely to face in the future if greenhouse gas emissions are not significantly reduced.

How much warmer could the planet become? How much could sea levels rise? Will human civilization be able to adapt to these changes? And what impacts are already being experienced by farmers in Serbia today?

These are some of the questions explored in the second episode of the Klima101 Podcast. Guests: Vladimir Đurđević and Aleksandar Luković

Nova S television (17.07.2024.):

The Planet Is Burning | Guest: Irida Lazić

<https://www.youtube.com/watch?v=onKQXjsaLQM&t=68s>

Description: Climate change refers to long-term shifts in temperatures and weather patterns. Such shifts can be natural, due to changes in the sun's activity or large volcanic eruptions. But since the 1800s, human activities have been the main driver of climate change, primarily due to the burning of fossil fuels like coal, oil and gas. Burning fossil fuels generates greenhouse gas emissions that act like a blanket wrapped around the Earth, trapping the sun's heat and raising temperatures. The main greenhouse gases that are causing climate change include carbon dioxide and methane. These come from using gasoline for driving a car or coal for heating a building, for example. Clearing land and cutting down forests can also release carbon dioxide. Agriculture, oil and gas operations are major sources of methane emissions. Energy, industry, transport, buildings, agriculture and land use are among the main sectors causing greenhouse gases.

Insajder television (26.05.2026):

More Than 200,000 People Without Water in Western Serbia: Residents Outraged by Water Shortages

<https://www.youtube.com/watch?v=MUQkiLR-Abw>

Description: More than 200,000 people in Western Serbia spent yesterday's summer heat without water following a major failure in the Rzav water supply system, which serves the municipalities of Požega, Čačak, Lučani, and Gornji Milanovac. According to an official statement issued by the City of Čačak, residents have been informed that tap water will not be suitable for drinking for the next ten days. Based on current estimates, water service in this part of Western Serbia is expected to be gradually restored by midday today.

Due to the water shortage, a state of emergency was declared yesterday in both Čačak and Gornji Milanovac. The public utility company "Vodovod" Čačak has published the locations of water tankers providing drinking water and announced that priority users, including the city hospital and several kindergartens, have been supplied. Residents, however, remain dissatisfied. According to their accounts, very few water tankers were available throughout the entire day yesterday, leaving many people without adequate access to drinking water despite the emergency measures.

Agromedia podcast (22.02.2026):

Climate Extremes in Serbia: Droughts, Floods, and Billions in Damages | Uroš Davidović

<https://www.youtube.com/watch?v=zYyGKXUmdss>

Description: The guest of this episode of the *Agro Priče* podcast is Uroš Davidović, a meteorologist and economist, with whom we openly discuss the real consequences of droughts and floods in Serbia and their impacts on agriculture, the economy, and everyday life. Between 2001 and 2024, climate extremes caused damages exceeding 10 billion euros, with the largest share of losses associated with drought and the agricultural sector. The devastating floods of 2014 demonstrated that the true cost of extreme weather extends far beyond the initial estimates, as indirect impacts affect energy production, food supply chains, infrastructure, and the broader economy.

Will droughts become more frequent and longer-lasting in the future? Why is Serbia considered one of the most climate-vulnerable countries in Europe? And what does adaptation of agriculture to changing climate conditions actually look like in practice?

In this episode, we explore the economic costs of climate change, the growing risks associated with extreme weather events, and the measures needed to strengthen resilience in agriculture and society as a whole.

Tanjug TV (03.07.2025.):

Extreme Drought in Serbia | Marija Ćosić

https://www.youtube.com/watch?v=VUEOT_YdPGQ

Description: Not only have exceptionally high temperatures marked the recent period, but also an extreme drought that is affecting agricultural yields, the economy, and people's daily lives. In large parts of Serbia, no significant rainfall has occurred for more than a month. The soil has become dry and cracked, water supply problems have emerged, and farmers are increasingly concerned about the future.

How can society adapt to these new climate conditions? What measures can be taken to reduce the impacts of drought? And how prepared are we for more frequent and severe drought events in the years ahead?

These are just some of the questions discussed with Marija Ćosić, who shares insights into the causes and consequences of drought, its connection to climate change, and the challenges facing agriculture and water management in Serbia.

Agrocast (03.05.2025.)

Irrigation in Serbia – Great Potential, Wrong Approach! | Aleksa Lipovac | AgroCast 83

<https://www.youtube.com/watch?v=F9T63epyHsk>

Description: The topic of this episode is irrigation, one of the key factors for ensuring stable and sustainable agricultural production under increasingly frequent drought conditions and a changing climate. Some of the main questions discussed include:

- How much agricultural land is currently irrigated in Serbia, and what irrigation methods are most commonly used?
- What would happen if all farmers relied exclusively on groundwater abstraction from wells?
- What is the long-term, systemic solution for irrigation development in Serbia?
- What is the quality of available water resources for irrigation?
- What impacts can irrigation have on soil properties and long-term soil productivity?

Together with Aleksa Lipovac, the discussion explores the current state of irrigation infrastructure, groundwater and surface water use, water availability, irrigation efficiency, soil salinization risks, and the challenges of developing climate-resilient agriculture in Serbia.

The episode also addresses sustainable water management strategies, the role of large-scale irrigation systems, and the importance of balancing agricultural water demand with the protection of water resources and soil quality.
